

# Intermediate Python Part 2

QLS-MiCM mission statement: deliver quality workshops designed to help biomedical researchers develop the skills they need to succeed.

Location: 550 Sherbrooke Street, Montreal, Quebec

#### Workshop Series

| Workshop                     | Date                    | Location           | Registration |
|------------------------------|-------------------------|--------------------|--------------|
| How to think in Code         | September 18 10AM-12PM  | Education Room 133 | Closed       |
| Intro to Git & GitHub        | September 25 8AM-12PM   | Education Room 133 | Closed       |
| Intro to Unix                | September 27 1PM-3PM    | Education Room 133 | Closed       |
| Intro to Python (Part 1)     | October 28 9AM-11AM     | Education Room 133 | <u>Open</u>  |
| Intermediate Python (Part 2) | November 110AM30-12AM30 | McIntyre Room 519  | <u>Open</u>  |
| Exploring Matlab             | November 4 10AM-12PM    | Education Room 133 | <u>Open</u>  |
| Intro to R (Part 1)          | November 13 1PM-5PM     | Education Room 133 | <u>Open</u>  |
| Statistics in R (Part 2)     | November 18 1PM-5PM     | McIntyre Room 519  | <u>Open</u>  |
| Data Visualization           | November 21 2PM-6PM     | Education Room 133 | TBA          |
| Intro to scRNA-seq           | November 25 10AM-12PM   | Education Room 133 | TBA          |
| Advanced scRNA-seq           | December 2 10AM-12PM    | Education Room 133 | TBA          |

#### Outline

- 1. Module 1 Getting Up to Speed (10 minutes)
  - a. Quick Review
- 2. Module 2 Introduction to Functions (45 minutes)
  - a. Function Overview
  - b. Writing Custom Functions
  - c. Documenting Functions
  - d. Exercise
- 3. Module 3 Modules and Packages (45 minutes)
  - a. Using Modules
  - b. Package and Environment Management
  - **c. Exercise**: Using textwrap to nicely print DNA sequences.
- 4. Module 4 Where to go from here (10 minutes)
  - a. What to learn next? How?
  - b. How to get help and how not to get help
  - c. Glimpse of other cool programming topics

## Module 1 Getting Up to Speed

## What is Python?

#### Welcome to the Python Programming Language!

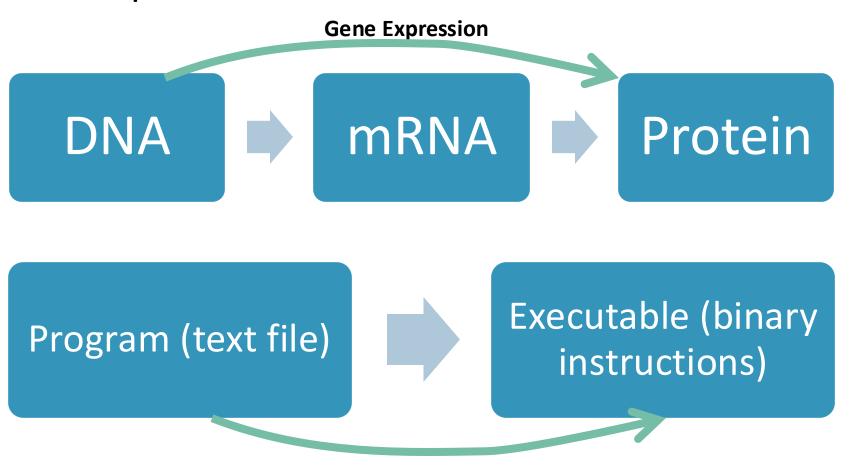

- For more history:
   https://en.wikipedia.org/wiki/History of Py
   thon
- Introduced in 1991 by Guido van Rossum
- Features:
  - Free and Open Source
  - Interpreted
  - Object-Oriented
- https://python.org

#### Free and Open Source

- Everyone is free to: download, use, modify and redistribute Python.
- Python is developed, in part, by the community of users.
- https://docs.python.org/3/license.html

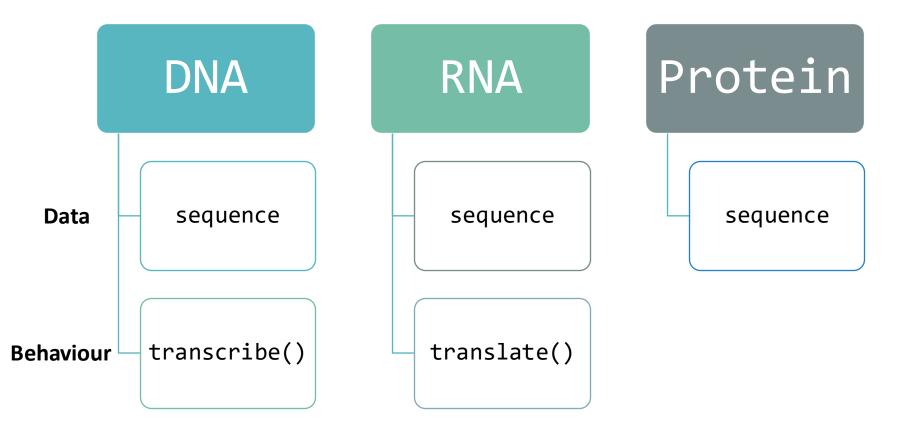

#### Interpreted

Interpretation (line-by-line)

### Object-Oriented

## Key Ideas and Syntax

## Variables & Data Types

```
# Primitive Data Types
       my_str = "Hello!"
Variable name must contain only letters, numbers and
        underscores. Can't start with a number!
                  (404, "Not Found")
       my_list = ["A", "G", "C", "U", "T"]
       my_dict = {
            "purines": ["A", "G"],
            "pyrimidines": ["C", "T", "U"],
                                                   Quantitative Life Sciences quantitatives
```

#### Control Flow

```
if block is
required!
```

elif blocks are optional; no fixed number.

Maximium one else block.

```
if some_boolean:
    run_some_code()
elif some_other_boolean:
    run_other_code()
elif yet_another_boolean:
    run_other_other_code()
else:
    run_code_if_no_match()
```

run\_code\_regardless()

Python relies on **indents** to define blocks.

If you stop indenting, the code runs regardless.

#### Loops

```
# while loop
  (Almost)
                    while some_boolean:
never use a
raw Boolean.
                         run_some_code()
                                                          Update the Boolean
                                                            during the loop.
  Block is
                         update_boolean()
 defined by
  indents.
                    run_other_code()
                    # for loop
                    for variable in some_iterable:
                                                                   Block is
  variable gets
                                                                  defined by
                         run_some_code()
     updated
                                                                   indents.
  automatically by
                    run_other_code()
  taking the next
      value.
                                             McGil
                                                          Quantitative Life
                                                                   Sciences quantitatives
```

du vivant

#### Interactive Workshop!

Let's go to a Jupyter Notebook:

To the repository!

# Module 3 Modules and Packages

#### Environments

#### Project 1

Python 3.9

NumPy 1.26

SciPy 1.12

Matplotlib 3.6

#### Project 2

Python 3.11

NumPy 2.0

scikit-learn 1.2

#### Project 3

Python 3.8

scikit-image 0.21

Matplotlib 3.3

PyQt5 5.15.5

#### To summarize

- ✓ Functions define chunks of reusable behaviour that we can easily call again. Functions should be documented using docstrings.
- ✓ Python uses a system of modules to allow easy reuse of code.
- ✓ Modules can be built-in, user-defined or included in packages.
- ✓ There are various tools to install packages, including pip and conda.
- ✓ Projects can use environments to manage dependencies.

#### Now you are ready to:

- Define and call new functions.
- Import and use code from built-in Python modules.
- Install new packages to access even more tools.

### Acknowledgements

- Thank you to QLS-MiCM for giving me this opportunity and for helping me along the way.
- Thank you to the professors from the McGill School of Computer Science for helping me along my programming journey and for inspiring me to share my programming experience with others.
- Thank you to Professor Mathieu Blanchette, whose COMP 204 course helped introduce me to Python (back in Fall 2018).
- Thank you to the Python community!
